I think the hardest part to debug was the dragging of objects in SVG (unfortunately!). It seemed that my coordinates were going out of bounds every time I moved the object. I performed calculations with the specific values being used, and everything looked fine. It turns out that I wasn't parsing the clicked location as ints, which caused the arithmetic calculations to be off. Otherwise, I think the hardest part of the implementation was the shadow effect on the SVG objects, as I encountered the problem of the shadow cutting off the shape and didn't really know why until performing a deep google search.

Other than that, I think that's it!
